P(True)

P(True)[46]

$$P(\text{True}) = \frac{\exp(z_A)}{\exp(z_A) + \exp(z_B)}$$

where z_A = logit for token "A (True)", z_B = logit for token "B (False)".

```
Question:  Who was the first president of the United States?
Proposed Answer: George Washington was the first president.
Is the proposed answer:
 (A) True
 (B) False
The proposed answer is:
```

P(True)[46]

- **Task Type:** Opening-end/Math/Code generation
- **Introduction:** LLM assess the truthfulness of its own answer by responding to a True/False self-evaluation question. The logits assigned to each option are processed to compute the final uncertainty score.

Type	Uncertainty Sources	Model Accessibility	Training Necessity	Consumption	Evaluation
Single-pass	-	White-box	Post-hoc	Low	Calibration/Ranking
